ON THE CONCENTRATION AND INTERNAL STRESS
OF THE FILM IN THE PERMEATION PROCESS.

Rept. No. 6 on Permeability of High Polymer Films to
Gases and Vapors. [1961] 11p. 5 refs.

Order from SLA m\$2.40, ph\$3.30

61-10602

Trans. of Kôbunshi Kagaku (Japan) 1960, v. 17,
no. 184, p. 489-492.

In the previous report, it was estimated that the reason why the permeability coefficient becomes large when the film thickness increases is because the concentration of the permeating vapor in the film is influenced by the film thickness; in the present report this phenomenon is explained by separating the film into a wet part and a dry part and by deriving a theoretical equation. From experiment results such as measurements of the slackening of the film at the time of permeation, it was also ascertained that the internal stress of the film differs depending on the thickness. (Chemistry--Physical, TT, v. 5, no. 12) (over)
